Remarks for all above layouts

- For the capacity it is assumed that 1-3 people skate next to each other in one lane (3-4m wide) with a distance of 1,5m-2m behind the next group. Example: 88m lane length / 2m distance = 44 groups behind each other x 2 skaters per group next to each other = 88 skaters in total. Allowing some extra space, the maximum capacity calculated is 80 skaters.
- The skating zones can be divided according to local skating culture. Some countries with many inexperienced skaters would want them to skate on the outer lane as inexperienced skaters often want to be close to the handrail. In other countries the outer lane might be more suitable for faster skaters as they would want wider corners than e.g. kids with skating aids. It also depends on the size of a given group at a given time as the outer zone can accommodate more people.
- Not more than 4 skaters in a group or family together without keeping distance.
- The total rink capacity should never exceed 1 skater per 4m² ice surface. Within a zone on the rink it can be higher as the safe distance lane creates some extra space.
- See other documents provided by Ice-World for general recommendations on a Covid-19 proof ice skating event.
- Please remember to check and comply with all local rules and regulations that apply to your event.
